Chapter 1

libtheora Main Page

1.1 Introduction

This is the documentation for the libtheora C API. libtheora is the reference implementation for **Theora**, a free video codec. Theora is derived from On2's VP3 codec with improved integration for Ogg multimedia formats by Xiph.Org.

Chapter 2

libtheora Data Structure Index

2.1 libtheora Data Structures

Here are the data structures with brief descriptions:

yuv_buffer	7
-----------------------------	---

Chapter 3

libtheora File Index

3.1 libtheora File List

Here is a list of all documented files with brief descriptions:

theora.h	9
---------------------------	---

Chapter 4

libtheora Data Structure Documentation

4.1 yuv_buffer Struct Reference

```
#include <theora.h>
```

Data Fields

- int **y_width**
- int **y_height**
- int **y_stride**
- int **uv_width**
- int **uv_height**
- int **uv_stride**
- unsigned char * **y**
- unsigned char * **u**
- unsigned char * **v**

4.1.1 Detailed Description

A YUV buffer.

The documentation for this struct was generated from the following file:

- **theora.h**

Chapter 5

libtheora File Documentation

5.1 theora.h File Reference

```
#include <ogg/ogg.h>
```

Data Structures

- struct **yuv_buffer**
- struct **theora_info**
- struct **theora_state**
- struct **theora_comment**

Defines

- #define **OC_FAULT** -1
- #define **OC_EINVAL** -10
- #define **OC_DISABLED** -11
- #define **OC_BADHEADER** -20
- #define **OC_NOTFORMAT** -21
- #define **OC_VERSION** -22
- #define **OC_IMPL** -23
- #define **OC_BADPACKET** -24
- #define **OC_NEWPACKET** -25

Typedefs

- typedef theora_comment **theora_comment**

Enumerations

- enum **theora_colorspace** { **OC_CS_UNSPECIFIED**, **OC_CS_ITU_REC_470M**, **OC_CS_ITU_REC_470BG** }

Functions

- `const char * theora_version_string (void)`
- `ogg_uint32_t theora_version_number (void)`
- `int theora_encode_init (theora_state *th, theora_info *c)`
- `int theora_encode_YUVin (theora_state *t, yuv_buffer *yuv)`
- `int theora_encode_packetout (theora_state *t, int last_p, ogg_packet *op)`
- `int theora_encode_header (theora_state *t, ogg_packet *op)`
- `int theora_encode_comment (theora_comment *tc, ogg_packet *op)`
- `int theora_encode_tables (theora_state *t, ogg_packet *op)`
- `int theora_decode_header (theora_info *ci, theora_comment *cc, ogg_packet *op)`
- `int theora_decode_init (theora_state *th, theora_info *c)`
- `int theora_decode_packetin (theora_state *th, ogg_packet *op)`
- `int theora_decode_YUVout (theora_state *th, yuv_buffer *yuv)`
- `double theora_granule_time (theora_state *th, ogg_int64_t granulepos)`
- `ogg_int64_t theora_granule_frame (theora_state *th, ogg_int64_t granulepos)`
- `void theora_info_init (theora_info *c)`
- `void theora_info_clear (theora_info *c)`
- `void theora_clear (theora_state *t)`
- `void theora_comment_init (theora_comment *tc)`
- `void theora_comment_add (theora_comment *tc, char *comment)`
- `void theora_comment_add_tag (theora_comment *tc, char *tag, char *value)`
- `char * theora_comment_query (theora_comment *tc, char *tag, int count)`
- `int theora_comment_query_count (theora_comment *tc, char *tag)`
- `void theora_comment_clear (theora_comment *tc)`

5.1.1 Detailed Description

The libtheora C API.

5.1.2 Enumeration Type Documentation

5.1.2.1 enum theora_colorspace

A Colorspace.

5.1.3 Function Documentation

5.1.3.1 void theora_clear (theora_state * *t*)

Free all internal data associated with a theora_state handle.

Parameters:

t A theora_state handle.

5.1.3.2 int theora_decode_header (theora_info * *ci*, theora_comment * *cc*, ogg_packet * *op*)

Decode an Ogg packet, with the expectation that the packet contains an initial header, comment data or codebook tables.

Parameters:

ci A theora_info structure to fill. This must have been previously initialized with **theora_info_init()**(p. 15). If *op* contains an initial header, **theora_decode_header()**(p. 11) will fill *ci* with the parsed header values. If *op* contains codebook tables, **theora_decode_header()**(p. 11) will parse these and attach an internal representation to *ci->codec_setup*.

cc A theora_comment structure to fill. If *op* contains comment data, **theora_decode_header()**(p. 11) will fill *cc* with the parsed comments.

op An ogg_packet structure which you expect contains an initial header, comment data or codebook tables.

Return values:

OC_BADHEADER *op* is NULL; OR the first byte of *op->packet* has the signature of an initial packet, but *op* is not a b_o_s packet; OR this packet has the signature of an initial header packet, but an initial header packet has already been seen; OR this packet has the signature of a comment packet, but the initial header has not yet been seen; OR this packet has the signature of a comment packet, but contains invalid data; OR this packet has the signature of codebook tables, but the initial header or comments have not yet been seen; OR this packet has the signature of codebook tables, but contains invalid data; OR the stream being decoded has a compatible version but this packet does not have the signature of a theora initial header, comments, or codebook packet

OC_VERSION The packet data of *op* is an initial header with a version which is incompatible with this version of libtheora.

OC_NEWPACKET the stream being decoded has an incompatible (future) version and contains an unknown signature.

0 Success

Note:

The normal usage is that **theora_decode_header()**(p. 11) be called on the first three packets of a theora logical bitstream in succession.

5.1.3.3 int theora_decode_init (theora_state * *th*, theora_info * *c*)

Initialize a theora_state handle for decoding.

Parameters:

th The theora_state handle to initialize.

c A theora_info struct filled with the desired decoding parameters. This is of course usually obtained from a previous call to **theora_decode_header()**(p. 11).

Returns:

0 Success

5.1.3.4 int theora_decode_packetin (theora_state * *th*, ogg_packet * *op*)

Input a packet containing encoded data into the theora decoder.

Parameters:

th A theora_state handle previously initialized for decoding.

op An ogg_packet containing encoded theora data.

Return values:

OC_BADPACKET *op* does not contain encoded video data

5.1.3.5 int theora_decode_YUVout (theora_state * *th*, yuv_buffer * *yuv*)

Output the next available frame of decoded YUV data.

Parameters:

th A theora_state handle previously initialized for decoding.

yuv A yuv_buffer(p. 7) in which libtheora should place the decoded data.

Return values:

0 Success

5.1.3.6 int theora_encode_comment (theora_comment * *tc*, ogg_packet * *op*)

Request a comment header packet from provided metadata. A pointer to the comment data is placed in a user-provided ogg_packet structure.

Parameters:

tc A theora_comment structure filled with the desired metadata

op An ogg_packet structure to fill. libtheora will set all elements of this structure, including a pointer to the encoded comment data. The memory for the comment data is owned by libtheora.

Return values:

0 Success

5.1.3.7 int theora_encode_header (theora_state * *t*, ogg_packet * *op*)

Request a packet containing the initial header. A pointer to the header data is placed in a user-provided ogg_packet structure.

Parameters:

t A theora_state handle previously initialized for encoding.

op An ogg_packet structure to fill. libtheora will set all elements of this structure, including a pointer to the header data. The memory for the header data is owned by libtheora.

Return values:

0 Success

5.1.3.8 int theora_encode_init (theora_state * *th*, theora_info * *c*)

Initialize the theora encoder.

Parameters:

th The theora_state handle to initialize for encoding.

ti A theora_info struct filled with the desired encoding parameters.

Returns:

0 Success

5.1.3.9 int theora_encode_packetout (theora_state * *t*, int *last_p*, ogg_packet * *op*)

Request the next packet of encoded video. The encoded data is placed in a user-provided ogg_packet structure.

Parameters:

t A theora_state handle previously initialized for encoding.

last_p ???

op An ogg_packet structure to fill. libtheora will set all elements of this structure, including a pointer to encoded data. The memory for the encoded data is owned by libtheora.

Return values:

0 No internal storage exists OR no packet is ready

-1 The encoding process has completed

1 Success

5.1.3.10 int theora_encode_tables (theora_state * *t*, ogg_packet * *op*)

Request a packet containing the codebook tables for the stream. A pointer to the codebook data is placed in a user-provided ogg_packet structure.

Parameters:

t A theora_state handle previously initialized for encoding.

op An ogg_packet structure to fill. libtheora will set all elements of this structure, including a pointer to the codebook data. The memory for the header data is owned by libtheora.

Return values:

0 Success

5.1.3.11 int theora_encode_YUVin (theora_state * *t*, yuv_buffer * *yuv*)

Input a YUV buffer into the theora encoder.

Parameters:

t A theora_state handle previously initialized for encoding.

yuv A buffer of YUV data to encode.

Return values:

OC_EINVAL Encoder is not ready, or is finished.

-1 The size of the given frame differs from those previously input

0 Success

5.1.3.12 `ogg_int64_t theora_granule_frame (theora_state * th, ogg_int64_t granulepos)`

Convert a granulepos to an absolute frame number. The granulepos is interpreted in the context of a given `theora_state` handle.

Parameters:

th A previously initialized `theora_state` handle (encode or decode)

granulepos The granulepos to convert.

Returns:

The frame number corresponding to *granulepos*.

Return values:

-1 The given granulepos is invalid (ie. negative)

5.1.3.13 `double theora_granule_time (theora_state * th, ogg_int64_t granulepos)`

Convert a granulepos to absolute time in seconds. The granulepos is interpreted in the context of a given `theora_state` handle.

Parameters:

th A previously initialized `theora_state` handle (encode or decode)

granulepos The granulepos to convert.

Returns:

The absolute time in seconds corresponding to *granulepos*.

Return values:

-1 The given granulepos is invalid (ie. negative)

5.1.3.14 `void theora_info_clear (theora_info * c)`

Clear a `theora_info` structure. All values within the given `theora_info` structure are cleared, and associated internal codec setup data is freed.

Parameters:

c A `theora_info` struct to initialize.

5.1.3.15 void theora_info_init (theora_info * c)

Initialize a theora_info structure. All values within the given theora_info structure are initialized, and space is allocated within libtheora for internal codec setup data.

Parameters:

c A theora_info struct to initialize.

5.1.3.16 ogg_uint32_t theora_version_number (void)

Retrieve a 32-bit version number. This number is composed of a 16-bit major version, 8-bit minor version and 8 bit sub-version, composed as follows:

```
(VERSION_MAJOR$<$$<$16) + (VERSION_MINOR$<$$<$8) + (VERSION_SUB)
```

Returns:

the version number.

5.1.3.17 const char* theora_version_string (void)

Retrieve a human-readable string to identify the vendor and version.

Returns:

a version string.
